# To Begin: A Cartoon in 2d

planewave

$$\vec{E}, \vec{H} \sim e^{i(\vec{k} \cdot \vec{x} - \omega t)}$$

$$|\vec{k}| = \omega / c = \frac{2\pi}{\lambda}$$

# To Begin: A Cartoon in 2d

planewave

$$\vec{E}, \vec{H} \sim e^{i(\vec{k} \cdot \vec{x} - \omega t)}$$

$$|\vec{k}| = \omega / c = \frac{2\pi}{\lambda}$$

for **most**  $\lambda$ , beam(s) propagate through crystal **without scattering** (scattering cancels **coherently**)

...but for **some**  $\lambda$  ( $\sim 2a$ ), no light can propagate: **a photonic band gap**

# Photonic Crystals

periodic electromagnetic media

with photonic band gaps: “optical insulators”

(need a more complex topology)

# Photonic Crystals in Nature

Peacock feather

*Morpho* butterfly

wing scale:

[ L. P. Biró *et al.*,  
*PRE* **67**, 021907  
(2003) ]

6.21  $\mu\text{m}$

[J. Zi *et al*, *Proc. Nat. Acad. Sci. USA*,  
**100**, 12576 (2003) ]

[figs: Blau, *Physics Today* **57**, 18 (2004)]

# Photonic Crystals

periodic electromagnetic media

can trap light in **cavities**

and **waveguides** (“wires”)

with photonic band gaps:  
“**optical insulators**”  
for holding and controlling light

# Photonic Crystals

periodic electromagnetic media

But how can we **understand** such complex systems?  
Add up the infinite sum of scattering? Ugh!

# A mystery from the 19th century

# A mystery from the 19th century

$\vec{E}$   $\longrightarrow$

current:  $\vec{J} = \sigma \vec{E}$

conductivity (measured)

mean free path (distance) of electrons

# A mystery solved...

- ① electrons are **waves** (quantum mechanics)
- ② waves in a **periodic medium** can propagate **without scattering**:

## Bloch's Theorem (1d: Floquet's)

The foundations **do not depend on the specific wave equation.**

# Electronic and Photonic Crystals

**Periodic Medium**  
**Bloch waves:**  
**Band Diagram**

atoms in diamond structure

electron energy

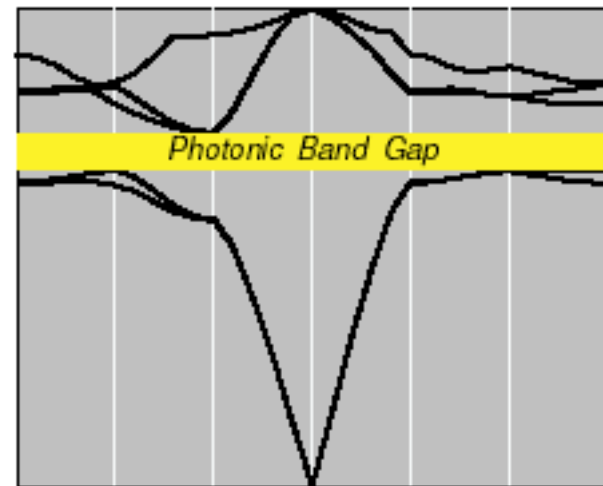

wavevector

interacting: hard problem

dielectric spheres, diamond lattice

photon frequency

wavevector

non-interacting: "easy" problem

# Time to Analyze the Cartoon

planewave

$$\vec{E}, \vec{H} \sim e^{i(\vec{k} \cdot \vec{x} - \omega t)}$$

$$|\vec{k}| = \omega / c = \frac{2\pi}{\lambda}$$

for **most**  $\lambda$ , beam(s) propagate through crystal **without scattering** (scattering cancels **coherently**)

...but for **some**  $\lambda$  ( $\sim 2a$ ), no light can propagate: **a photonic band gap**

# Fun with Math

$$\vec{\nabla} \times \vec{E} = -\frac{1}{c} \frac{\partial}{\partial t} \vec{H} = i \frac{\omega}{c} \vec{H}$$

First task:  
get rid of this mess

$$\vec{\nabla} \times \vec{H} = \epsilon \frac{1}{c} \frac{\partial}{\partial t} \vec{E} + \vec{J} = i \frac{\omega}{c} \epsilon \vec{E}$$

dielectric function  $\epsilon(\mathbf{x}) = n^2(\mathbf{x})$

$$\underbrace{\nabla \times \frac{1}{\epsilon} \nabla \times}_{\text{eigen-operator}} \vec{H} = \underbrace{\left( \frac{\omega}{c} \right)^2}_{\text{eigen-value}} \underbrace{\vec{H}}_{\text{eigen-state}} \quad \begin{array}{l} + \text{constraint} \\ \nabla \cdot \vec{H} = 0 \end{array}$$

# Hermitian Eigenproblems

$$\underbrace{\nabla \times \frac{1}{\epsilon} \nabla \times}_{\text{eigen-operator}} \vec{H} = \underbrace{\left( \frac{\omega}{c} \right)^2}_{\text{eigen-value}} \underbrace{\vec{H}}_{\text{eigen-state}} \quad \begin{array}{l} \text{+ constraint} \\ \nabla \cdot \vec{H} = 0 \end{array}$$

Hermitian for real (lossless)  $\epsilon$

➔ well-known properties from linear algebra:

$\omega$  are real (lossless)

eigen-states are orthogonal

eigen-states are complete (give all solutions)

# Periodic Hermitian Eigenproblems

[ G. Floquet, “Sur les équations différentielles linéaires à coefficients périodiques,” *Ann. École Norm. Sup.* **12**, 47–88 (1883). ]  
 [ F. Bloch, “Über die quantenmechanik der electronen in kristallgittern,” *Z. Physik* **52**, 555–600 (1928). ]

if eigen-operator is periodic, then Bloch-Floquet theorem applies:

can choose: 
$$\vec{H}(\vec{x}, t) = e^{i(\vec{k} \cdot \vec{x} - \omega t)} \vec{H}_{\vec{k}}(\vec{x})$$

planewave
periodic “envelope”

Corollary 1:  $\mathbf{k}$  is conserved, *i.e.* no scattering of Bloch wave

Corollary 2:  $\vec{H}_{\vec{k}}$  given by finite unit cell,  
 so  $\omega$  are discrete  $\omega_n(\mathbf{k})$

# Periodic Hermitian Eigenproblems

Corollary 2:  $\vec{H}_{\vec{k}}$  given by finite unit cell,  
so  $\omega$  are discrete  $\omega_n(\mathbf{k})$

band diagram (dispersion relation)

map of  
what states  
exist &  
can interact

range of  $k$ ?

# Periodic Hermitian Eigenproblems in 1d

$$H(x) = e^{ikx} H_k(x)$$

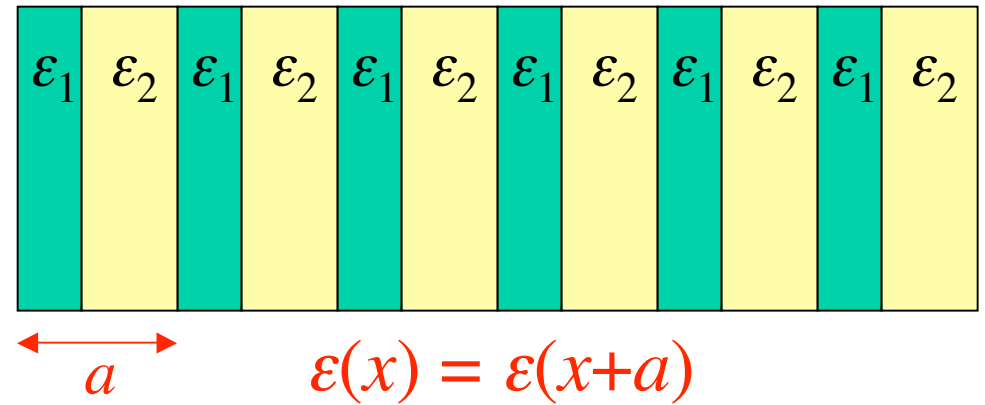

Consider  $k+2\pi/a$ : 
$$e^{i(k+\frac{2\pi}{a})x} H_{k+\frac{2\pi}{a}}(x) = e^{ikx} \left[ e^{i\frac{2\pi}{a}x} H_{k+\frac{2\pi}{a}}(x) \right]$$

$k$  is periodic:  
 $k + 2\pi/a$  equivalent to  $k$   
 “quasi-phase-matching”

periodic!  
 satisfies same  
 equation as  $H_k$   
 $= H_k$

# Periodic Hermitian Eigenproblems in 1d

$k$  is periodic:  
 $k + 2\pi/a$  equivalent to  $k$   
“quasi-phase-matching”

# Any 1d Periodic System has a Gap

[ Lord Rayleigh, “On the maintenance of vibrations by forces of double frequency, and on the propagation of waves through a medium endowed with a periodic structure,” *Philosophical Magazine* **24**, 145–159 (1887). ]

Start with  
a uniform (1d) medium:

# Any 1d Periodic System has a Gap

[ Lord Rayleigh, "On the maintenance of vibrations by forces of double frequency, and on the propagation of waves through a medium endowed with a periodic structure," *Philosophical Magazine* **24**, 145–159 (1887). ]

Treat it as  
"artificially" periodic

$$\epsilon(x) = \epsilon(x+a)$$

bands are "folded"  
by  $2\pi/a$  equivalence

# Any 1d Periodic System has a Gap

[ Lord Rayleigh, “On the maintenance of vibrations by forces of double frequency, and on the propagation of waves through a medium endowed with a periodic structure,” *Philosophical Magazine* **24**, 145–159 (1887). ]

Treat it as  
“artificially” periodic

# Any 1d Periodic System has a Gap

[ Lord Rayleigh, “On the maintenance of vibrations by forces of double frequency, and on the propagation of waves through a medium endowed with a periodic structure,” *Philosophical Magazine* **24**, 145–159 (1887). ]

Add a small  
“real” periodicity

$$\varepsilon_2 = \varepsilon_1 + \Delta\varepsilon$$

# Any 1d Periodic System has a Gap

[ Lord Rayleigh, "On the maintenance of vibrations by forces of double frequency, and on the propagation of waves through a medium endowed with a periodic structure," *Philosophical Magazine* **24**, 145–159 (1887). ]

Add a small  
"real" periodicity

$$\epsilon_2 = \epsilon_1 + \Delta\epsilon$$

Splitting of degeneracy:

state concentrated in higher index ( $\epsilon_2$ )

has lower frequency

# Some 2d and 3d systems have gaps

- In general, eigen-frequencies satisfy **Variational Theorem**:

$$\omega_1(\vec{k})^2 = \min_{\substack{\vec{E}_1 \\ \nabla \cdot \epsilon \vec{E}_1 = 0}} \frac{\int \left| (\nabla + i\vec{k}) \times \vec{E}_1 \right|^2}{\int \epsilon \left| \vec{E}_1 \right|^2} c^2$$

“kinetic”  
inverse  
“potential”

$$\omega_2(\vec{k})^2 = \min_{\substack{\vec{E}_2 \\ \nabla \cdot \epsilon \vec{E}_2 = 0 \\ \int \epsilon E_1^* \cdot E_2 = 0}} \dots$$

bands **“want”** to be in **high- $\epsilon$**   
 ...but are forced out by **orthogonality**  
 → **band gap** (maybe)

# A 2d Model System

Square lattice of dielectric rods ( $\epsilon = 12 \sim \text{Si}$ ) in air ( $\epsilon = 1$ )

# Solving the Maxwell Eigenproblem

*Finite cell* → discrete eigenvalues  $\omega_n$

Want to solve for  $\omega_n(\mathbf{k})$ ,  
& plot vs. “all”  $\mathbf{k}$  for “all”  $n$ ,

$$(\nabla + i\mathbf{k}) \times \frac{1}{\varepsilon} (\nabla + i\mathbf{k}) \times \mathbf{H}_n = \frac{\omega_n^2}{c^2} \mathbf{H}_n$$

$$\text{constraint: } (\nabla + i\mathbf{k}) \cdot \mathbf{H} = 0$$

where:  $\mathbf{H}(x,y) e^{i(\mathbf{k}\cdot\mathbf{x} - \omega t)}$

- 1 Limit range of  $\mathbf{k}$ : irreducible Brillouin zone
- 2 Limit degrees of freedom: expand  $\mathbf{H}$  in finite basis
- 3 Efficiently solve eigenproblem: iterative methods

# Solving the Maxwell Eigenproblem: 1

① Limit range of  $\mathbf{k}$ : irreducible Brillouin zone

— Bloch's theorem: solutions are **periodic in  $\mathbf{k}$**

**first Brillouin zone**  
= minimum  $|\mathbf{k}|$  “primitive cell”

**irreducible Brillouin zone: reduced by symmetry**

② Limit degrees of freedom: expand  $\mathbf{H}$  in finite basis

③ Efficiently solve eigenproblem: iterative methods

# Solving the Maxwell Eigenproblem: 2a

- 1 Limit range of  $\mathbf{k}$ : irreducible Brillouin zone
- 2 Limit degrees of freedom: expand  $\mathbf{H}$  in finite basis ( $N$ )

$$|\mathbf{H}\rangle = \mathbf{H}(\mathbf{x}_t) = \sum_{m=1}^N h_m \mathbf{b}_m(\mathbf{x}_t) \quad \text{solve: } \hat{A}|\mathbf{H}\rangle = \omega^2 |\mathbf{H}\rangle$$

finite matrix problem:  $Ah = \omega^2 Bh$

$$\langle \mathbf{f} | \mathbf{g} \rangle = \int \mathbf{f}^* \cdot \mathbf{g} \quad A_{ml} = \langle \mathbf{b}_m | \hat{A} | \mathbf{b}_l \rangle \quad B_{ml} = \langle \mathbf{b}_m | \mathbf{b}_l \rangle$$

- 3 Efficiently solve eigenproblem: iterative methods

# Solving the Maxwell Eigenproblem: 2b

- ① Limit range of  $\mathbf{k}$ : irreducible Brillouin zone
- ② Limit degrees of freedom: expand  $\mathbf{H}$  in **finite basis**
  - must satisfy **constraint**:  $(\nabla + i\mathbf{k}) \cdot \mathbf{H} = 0$

## Planewave (FFT) basis

$$\mathbf{H}(\mathbf{x}_t) = \sum_{\mathbf{G}} \mathbf{H}_{\mathbf{G}} e^{i\mathbf{G} \cdot \mathbf{x}_t}$$

constraint:  $\mathbf{H}_{\mathbf{G}} \cdot (\mathbf{G} + \mathbf{k}) = 0$

uniform “grid,” **periodic** boundaries,  
simple code,  $O(N \log N)$

## Finite-element basis

[ figure: Peyrilloux *et al.*,  
*J. Lightwave Tech.*  
21, 536 (2003) ]

constraint, boundary conditions:

**Nédélec elements**

[ Nédélec, *Numerische Math.*  
35, 315 (1980) ]

**nonuniform** mesh,  
more **arbitrary boundaries**,  
**complex** code & mesh,  $O(N)$

- ③ Efficiently solve eigenproblem: iterative methods

# Solving the Maxwell Eigenproblem: 3a

- ① Limit range of  $\mathbf{k}$ : irreducible Brillouin zone
- ② Limit degrees of freedom: expand  $\mathbf{H}$  in finite basis
- ③ Efficiently solve eigenproblem: **iterative methods**

$$Ah = \omega^2 Bh$$

**Slow way:** compute  $A$  &  $B$ , ask LAPACK for eigenvalues  
— requires  $O(N^2)$  storage,  **$O(N^3)$  time**

**Faster way:**

- start with *initial guess* eigenvector  $h_0$
- *iteratively* improve
- $O(Np)$  storage,  $\sim O(Np^2)$  time for  $p$  eigenvectors  
( $p$  **smallest** eigenvalues)

# Solving the Maxwell Eigenproblem: 3b

- ① Limit range of  $\mathbf{k}$ : irreducible Brillouin zone
- ② Limit degrees of freedom: expand  $\mathbf{H}$  in finite basis
- ③ Efficiently solve eigenproblem: iterative methods

$$Ah = \omega^2 Bh$$

Many iterative methods:

- Arnoldi, Lanczos, Davidson, Jacobi-Davidson, ...,  
Rayleigh-quotient minimization

# Solving the Maxwell Eigenproblem: 3c

- ① Limit range of  $\mathbf{k}$ : irreducible Brillouin zone
- ② Limit degrees of freedom: expand  $\mathbf{H}$  in finite basis
- ③ Efficiently solve eigenproblem: iterative methods

$$Ah = \omega^2 Bh$$

Many iterative methods:

- Arnoldi, Lanczos, Davidson, Jacobi-Davidson, ...,  
Rayleigh-quotient minimization

for Hermitian matrices, smallest eigenvalue  $\omega_0$  minimizes:

“variational theorem”

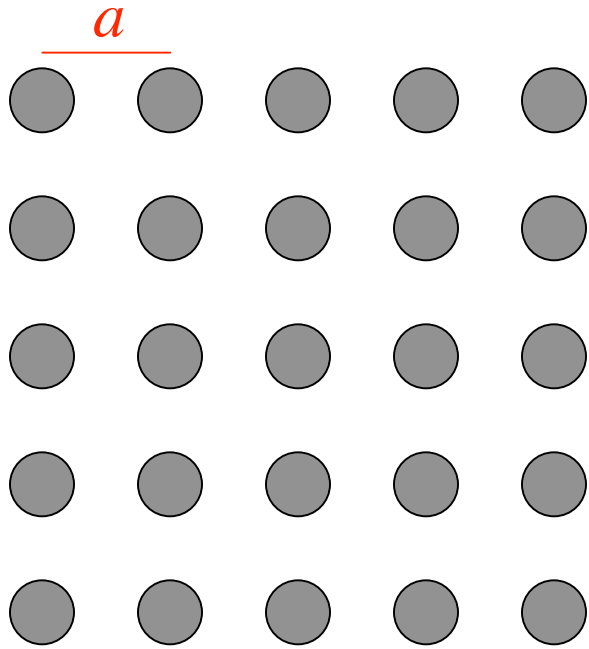

$$\omega_0^2 = \min_h \frac{h' Ah}{h' Bh}$$

minimize by preconditioned conjugate-gradient (or...)

[ S. Fan *et al.*, *Phys. Rev. Lett.* **80**, 960 (1998) ]

# Enough passive, linear devices...

Photonic crystal cavities:

tight confinement ( $\sim \lambda/2$  diameter)

+ long lifetime (high  $Q$  independent of size)

= enhanced nonlinear effects

e.g. Kerr nonlinearity,  $\Delta n \sim \text{intensity}$

# A ~~Linear~~ *Nonlinear* Filter

Linear response:  
Lorentzian Transmisson

+ nonlinear  
index shift

# A ~~Linear~~ *Nonlinear* “Transistor”

[ Soljacic *et al.*, *PRE Rapid. Comm.* **66**, 055601 (2002). ]

*Logic gates, switching,  
rectifiers, amplifiers,  
isolators, ...*

+ feedback  
shifted peak

**Bistable** (hysteresis) response

**Power threshold** is **near optimal**  
(~mW for Si and telecom bandwidth)

# Enough passive, linear devices...

Photonic crystal cavities:

tight confinement ( $\sim \lambda/2$  diameter)

+ long lifetime (high  $Q$  independent of size)

= enhanced nonlinear effects

Photonic crystal waveguides:

tight confinement ( $\sim \lambda/2$  diameter)

+ slow light (e.g. near band edge)

= enhanced nonlinear effects

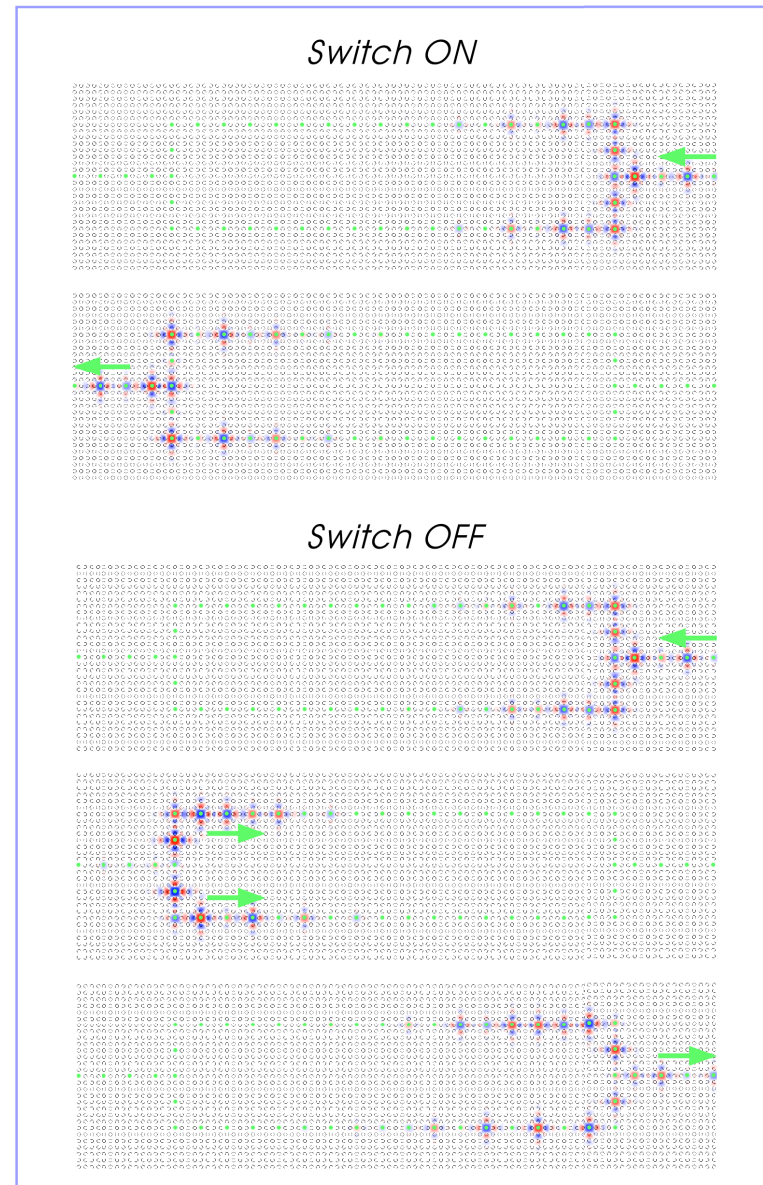

# Cavities + Cavities = Waveguide

coupled-cavity waveguide (CCW/CROW): **slow light** + **zero dispersion**

# Enhancing tunability with slow light

## Photonic Crystal Slow-Light Enhancement of Non-linear Phase Sensitivity

[ M. Soljagic *et al.*, *J. Opt. Soc. Am. B* **19**, 2052 (2002) ]

periodicity:

light is slowed, but not reflected

# Slow Light Enhances Everything

Get a factor of  $1/v_g$  (or more) enhancement of:

Nonlinearity, gain (e.g. DBR lasers),  
magneto-optic effects, loss...

Whoops!

...but device  
length decreases by  $v_g$  too

Uh oh, we live in 3d...

# 2d-like defects in 3d

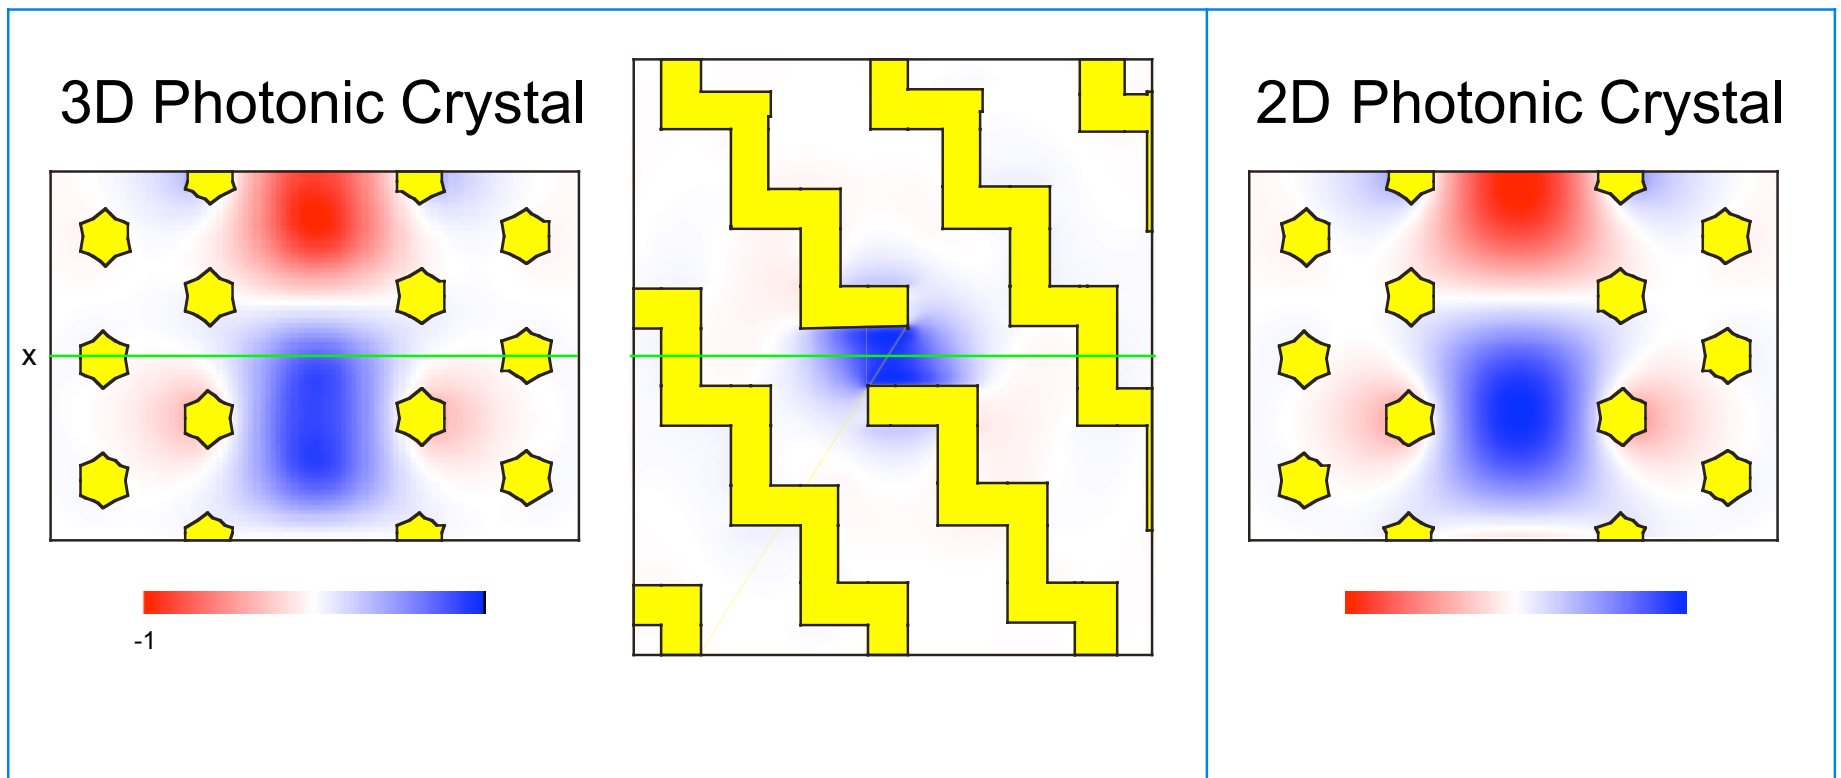

[ M. L. Povinelli *et al.*, *Phys. Rev. B* **64**, 075313 (2001) ]

# 3d projected band diagram

# 2d-like waveguide mode

# 2d-like cavity mode

# The Upshot

To design an interesting device, you need only:

**symmetry** + single-mode (usually)

+ resonance

+ (ideally) **a band gap** to forbid losses

Oh, and a full Maxwell simulator to get  $Q$  parameters, *etcetera*.

# Outline

- Preliminaries: waves in periodic media
- Photonic crystals in theory and practice
- Bulk crystal properties
- Intentional defects and devices
- **Index-guiding and incomplete gaps**
- Perturbations, tuning, and disorder

# Review: Bloch Basics

Waves in **periodic media** can have:

- propagation with **no scattering** (conserved  $\mathbf{k}$ )
- **photonic band gaps** (with proper  $\epsilon$  function)

**Eigenproblem** gives simple insight:

Bloch form: 
$$\vec{H} = e^{i(\vec{k} \cdot \vec{x} - \omega t)} \vec{H}_{\vec{k}}(\vec{x})$$

$$\left[ (\vec{\nabla} + i\vec{k}) \times \frac{1}{\epsilon} (\vec{\nabla} + i\vec{k}) \times \right] \vec{H}_{\vec{k}} = \left( \frac{\omega_n(\vec{k})}{c} \right)^2 \vec{H}_{\vec{k}}$$

$\hat{\Theta}_{\vec{k}}$

**Hermitian**  $\rightarrow$  complete, orthogonal, variational theorem, *etc.*

band diagram

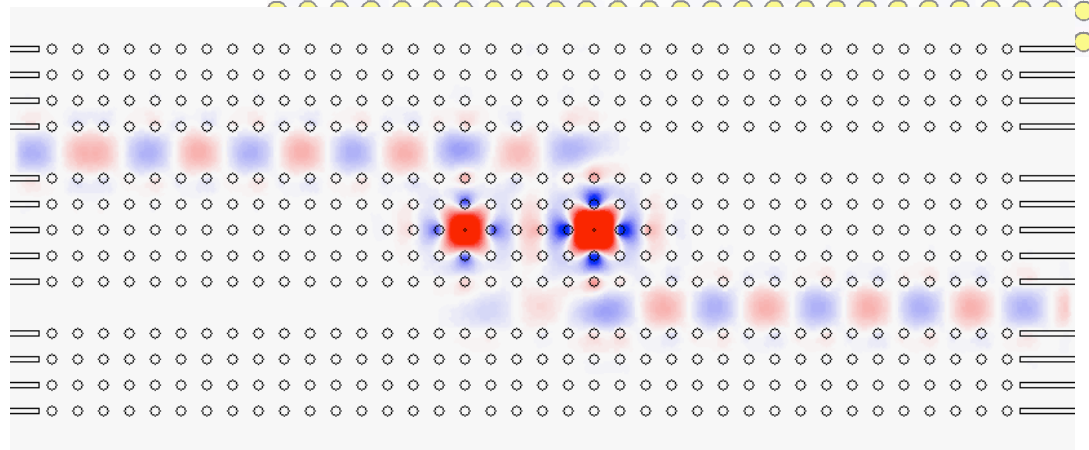

# Review: Defects and Devices

Point defects = Cavities

Waveguides  
+  
Resonant  
Cavities

Line defects = Waveguides

# Review: 3d Crystals and Fabrication

Much **progress**  
in **making complex structures**

...

incorporation of **defects & devices**  
still in **early stages**

How *else* can we confine light?

# Total Internal Reflection

rays at **shallow angles**  $> \theta_c$   
are totally reflected

Snell's Law:  
 $n_i \sin\theta_i = n_o \sin\theta_o$

$$\sin\theta_c = n_o / n_i$$

$< 1$ , so  $\theta_c$  is real

*i.e.* TIR can only guide  
within higher index  
**unlike a band gap**

# Total Internal Reflection?

rays at **shallow angles**  $> \theta_c$   
are totally reflected

So, for example,  
a **discontiguous structure** can't **possibly** guide by TIR...

the rays can't stay inside!

# Total Internal Reflection?

rays at **shallow angles**  $> \theta_c$   
are totally reflected

So, for example,  
a **discontiguous structure** can't **possibly** guide by TIR...

**or can it?**

# Total Internal Reflection Redux

ray-optics picture is **invalid** on  $\lambda$  scale  
(neglects **coherence**, **near field**...)

Snell's Law is really  
**conservation of  $k_{\parallel}$  and  $\omega$ :**

$$|k_i| \sin\theta_i = |k_o| \sin\theta_o$$

$|k| = n\omega/c$   
(wavevector)      (frequency)

# Waveguide Dispersion Relations

*i.e.* projected band diagrams

$$n_i > n_o$$

# Strange Total Internal Reflection

*Index Guiding*

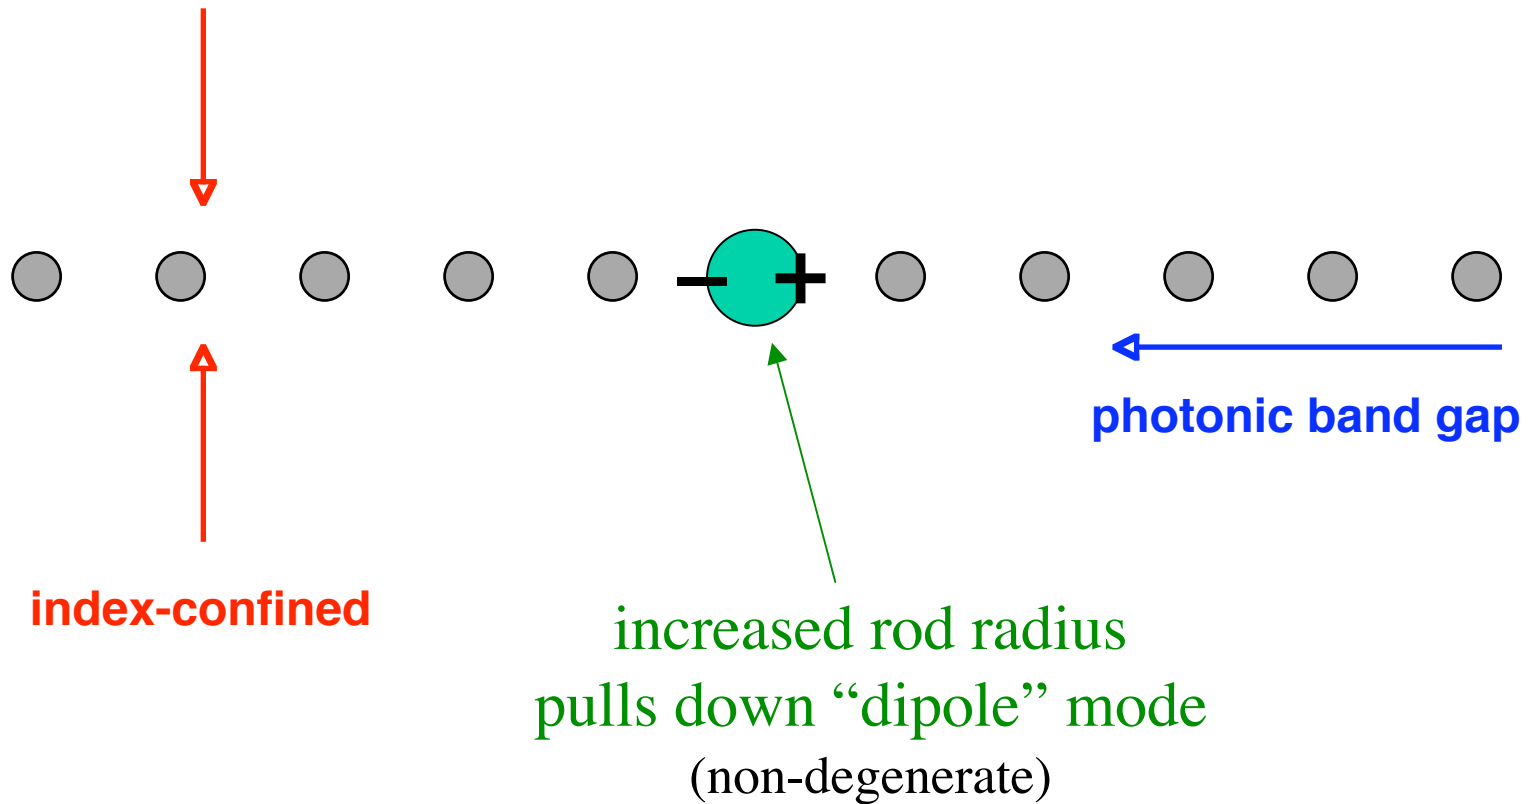

Conserved  $k$  and  $\omega$   
+ higher index to pull down state  
= localized/guided mode.

# A Hybrid Photonic Crystal:

1d band gap + index guiding

# A Resonant Cavity

# A Resonant Cavity

index-confined

$k$  not conserved  
so coupling to  
light cone:  
**radiation**

The **trick** is to  
keep the  
**radiation small...**  
(more on this later)

Meanwhile, back in reality...

## Air-bridge Resonator: $1d$ gap + $2d$ index guiding

[ D. J. Ripin *et al.*, *J. Appl. Phys.* **87**, 1578 (2000) ]

# Time for Two Dimensions...

2d is all we really need for many interesting devices  
...darn  $z$  direction!

# How do we make a 2d bandgap?

Most **obvious**  
**solution?**

make  
2d pattern  
*really tall*

# How do we make a 2d bandgap?

If height is **finite**,  
we must couple to  
out-of-plane wavevectors...

$k_z$  not conserved

# A 2d band diagram in 3d

Let's start with the 2d band diagram.

This is what we'd like to have in 3d, too!

Square Lattice of Dielectric Rods

$$(\epsilon = 12, r=0.2a)$$

# A 2d band diagram in 3d

Let's start with the 2d band diagram.

This is what we'd like to have in 3d, too! 3D Structure:

Square Lattice of Dielectric Rods  
( $\epsilon = 12, r=0.2a$ )

No! When we include out-of-plane propagation, we get:

wavevector   frequency

$\omega$

$\omega + \delta\omega$

projected band diagram fills gap!

# Photonic-Crystal Slabs

2d photonic bandgap + vertical index guiding

[ S. G. Johnson and J. D. Joannopoulos, *Photonic Crystals: The Road from Theory to Practice* ]

# Rod-Slab Projected Band Diagram

Square Lattice of Dielectric Rods  
 ( $\epsilon = 12, r=0.2a, h=2a$ )

*The Light Cone:*

All possible states propagating in the **air**

*The Guided Modes:*

Cannot couple to the light cone...  
 —> **confined to the slab**

*Thickness is critical.*

Should be about  $\lambda/2$   
 (to have a gap  
 & be single-mode)

# Symmetry in a Slab

2d: **TM** and **TE** modes

slab: **odd** (TM-like) and **even** (TE-like) modes

Like in 2d, there may **only** be a band gap  
in **one symmetry**/polarization

# Slab Gaps

Square Lattice of  
Dielectric Rods  
( $\epsilon = 12, r=0.2a, h=2a$ )

Triangular Lattice  
of Air Holes  
( $\epsilon = 12, r=0.3a, h=0.5a$ )

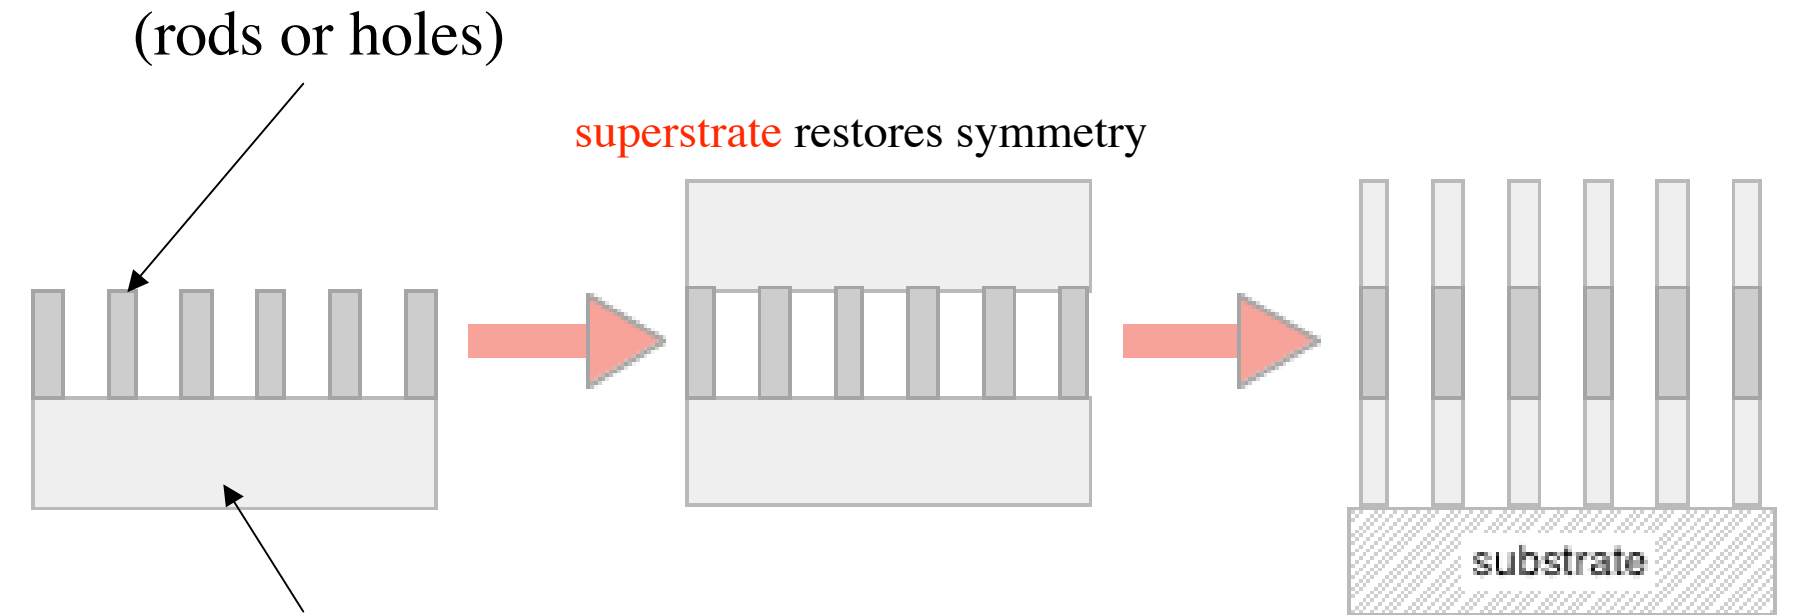

TM-like gap

TE-like gap

# Substrates, for the Gravity-Impaired

substrate breaks symmetry:  
some even/odd mixing “kills” gap

**BUT**

with strong confinement  
(high index contrast)

mixing can be weak

“extruded” substrate  
= stronger confinement

(less mixing even  
without superstrate)

# Extruded Rod Substrate

S. Assefa, L. A. Kolodziejski

(GaAs on AlO<sub>x</sub>)

[ S. Assefa *et al.*, *APL* **85**, 6110 (2004). ]

# Air-membrane Slabs

who needs a substrate?

[ N. Carlsson *et al.*, *Opt. Quantum Elec.* **34**, 123 (2002) ]

# Optimal Slab Thickness

$\sim \lambda/2$ , but  $\lambda/2$  in what material?

effective medium theory: effective  $\epsilon$  depends on polarization

# Photonic-Crystal Building Blocks

point defects  
(cavities)

line defects  
(waveguides)

# A Reduced-Index Waveguide

We cannot **completely** remove the rods — no vertical confinement!

Still have **conserved wavevector** — under the light cone, **no radiation**

Reduce the **radius** of a row of rods to **“trap”** a waveguide mode in the gap.

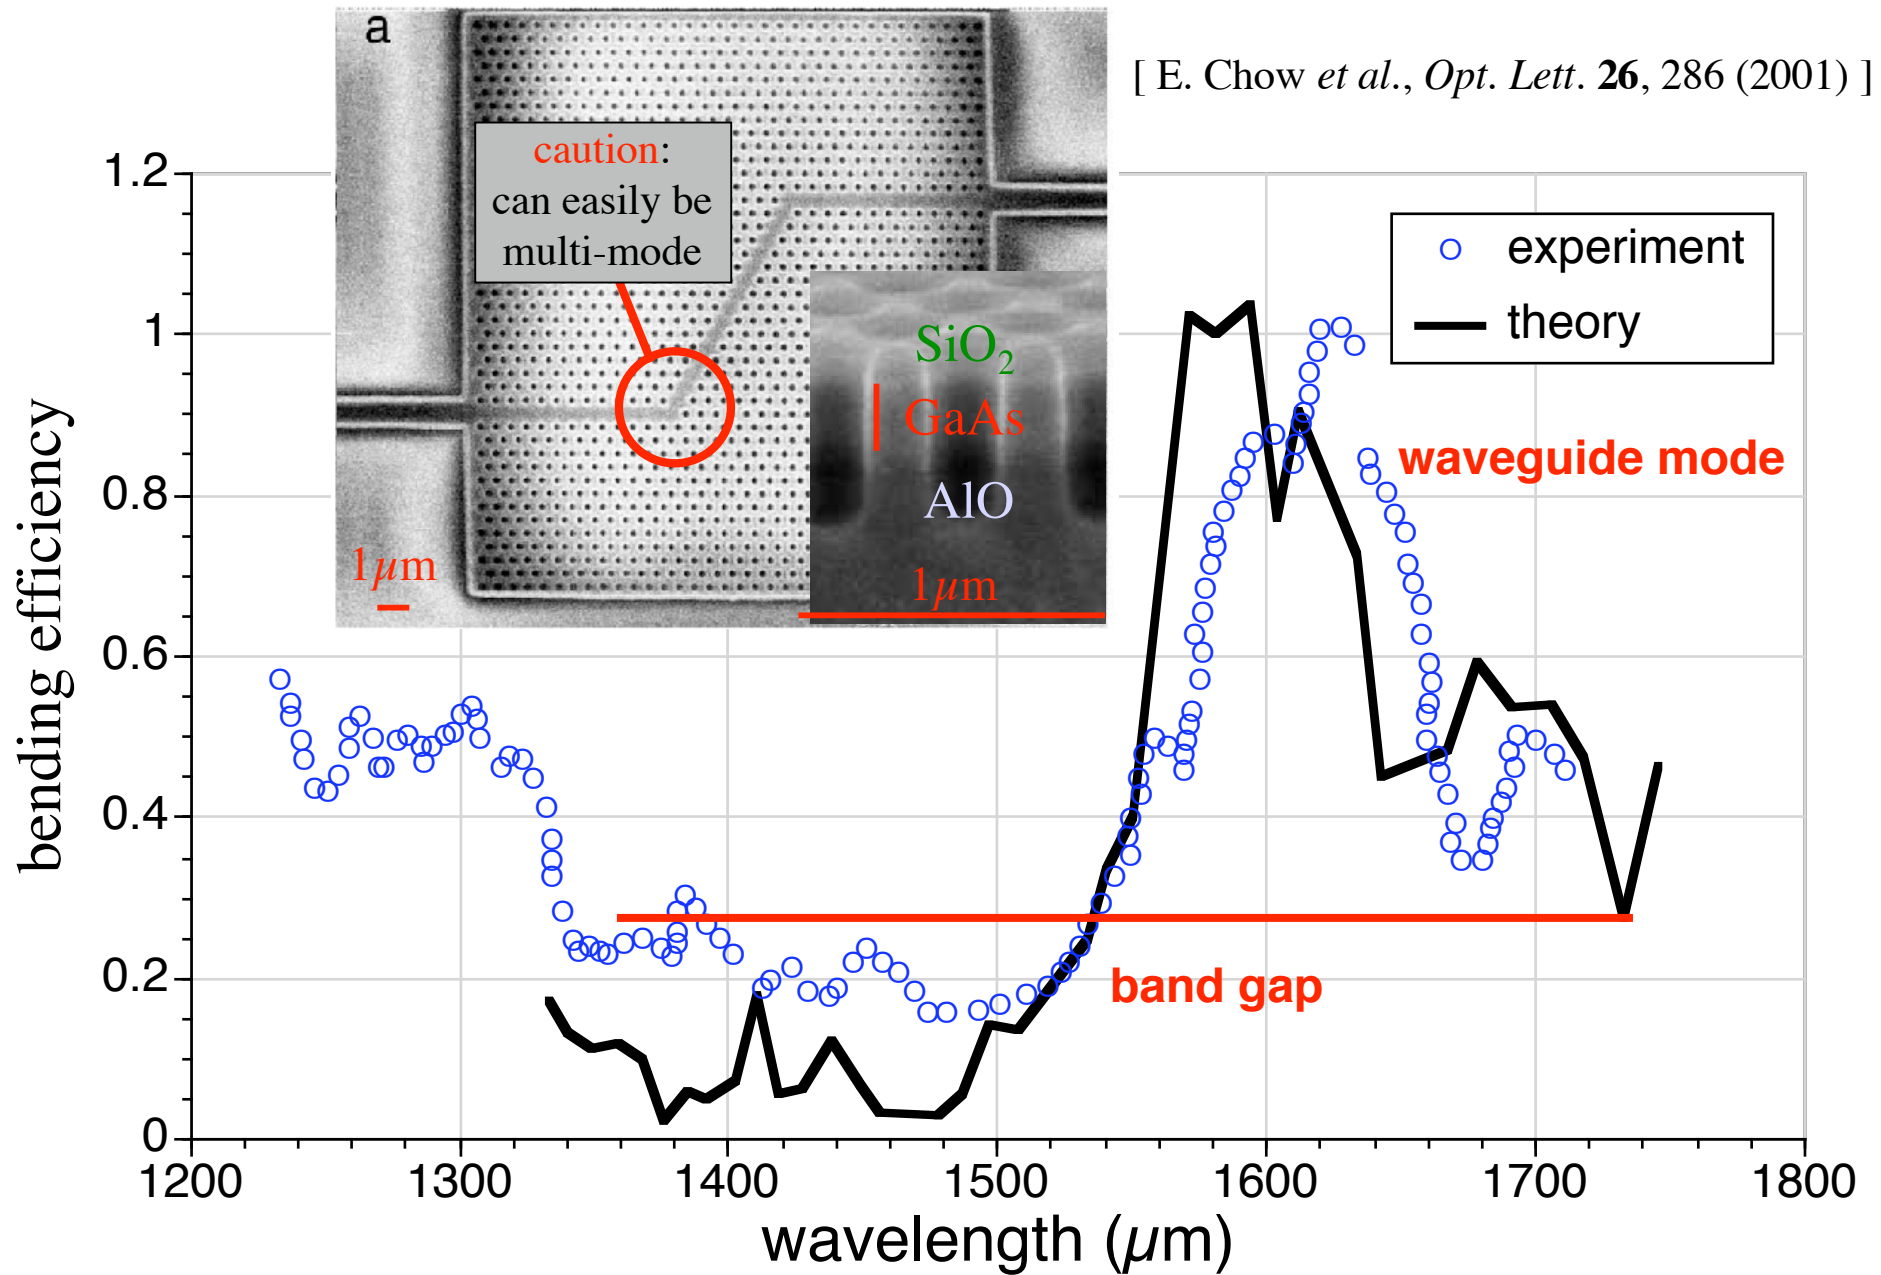

# Reduced-Index Waveguide Modes

# Experimental Waveguide & Bend

[ E. Chow *et al.*, *Opt. Lett.* **26**, 286 (2001) ]

# Inevitable Radiation Losses

whenever translational symmetry is broken

e.g. at cavities, waveguide bends, disorder...

# Dimensionless Losses: $Q$

quality factor  $Q = \#$  optical periods for energy to decay by  $\exp(-2\pi)$

$$\text{energy} \sim \exp(-\omega t/Q)$$

in frequency domain:  $1/Q = \text{bandwidth}$

*from last time:  
(coupling-of-  
modes-in-time)*

$T =$  Lorentzian filter

$$= \frac{\frac{4}{\tau^2}}{(\omega - \omega_0)^2 + \frac{4}{\tau^2}}$$

...quality factor  $Q$

# All Is Not Lost

A simple model device (filters, bends, ...):

$$\frac{1}{Q} = \frac{1}{Q_r} + \frac{1}{Q_w}$$

$Q = \text{lifetime}/\text{period}$   
 $= \text{frequency}/\text{bandwidth}$

We want:  $Q_r \gg Q_w$

$1 - \text{transmission} \sim 2Q / Q_r$

**worst case:** high-Q (narrow-band) cavities

# Semi-analytical losses

A low-loss strategy:

Make field inside defect small  
= delocalize mode

Make defect weak  
= delocalize mode

$$\vec{E}(\vec{x}) = \int_{\text{defect}} \vec{G}_{\omega}(\vec{x}, \vec{x}') \cdot \vec{E}(\vec{x}') \cdot \Delta \varepsilon(\vec{x}')$$

Diagram illustrating the semi-analytical loss calculation equation:

The equation is:  $\vec{E}(\vec{x}) = \int_{\text{defect}} \vec{G}_{\omega}(\vec{x}, \vec{x}') \cdot \vec{E}(\vec{x}') \cdot \Delta \varepsilon(\vec{x}')$

Labels and connections:

- $\vec{E}(\vec{x})$  is labeled "far-field (radiation)".
- $\vec{G}_{\omega}(\vec{x}, \vec{x}')$  is labeled "Green's function (defect-free system)".
- $\vec{E}(\vec{x}')$  is labeled "near-field (cavity mode)".
- $\Delta \varepsilon(\vec{x}')$  is labeled "defect".

Annotations:

- Two red arrows point from the text "Make field inside defect small = delocalize mode" and "Make defect weak = delocalize mode" to the  $\vec{E}(\vec{x}')$  and  $\Delta \varepsilon(\vec{x}')$  terms, respectively.

# Monopole Cavity in a Slab

Lower the  $\epsilon$  of a single rod: push up a monopole (singlet) state.

↑  
decreasing  $\epsilon$

Use small  $\Delta\epsilon$ : delocalized in-plane,  
& high-Q (we hope)

# Delocalized Monopole Q

[ S. G. Johnson *et al.*, *Computing in Sci. and Eng.* **3**, 38 (2001). ]

# Super-defects

Weaker defect with more unit cells.

More delocalized  
at the same point in the gap  
(*i.e.* at same bulk decay rate)

# Super-Defect vs. Single-Defect Q

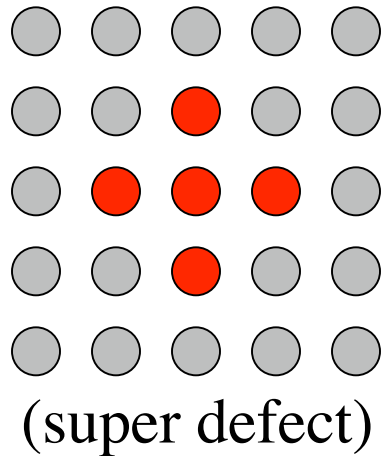

[ S. G. Johnson *et al.*, *Computing in Sci. and Eng.* **3**, 38 (2001). ]

# Super-Defect State

(cross-section)

$$\Delta\varepsilon = -3, Q_{\text{rad}} = 13,000$$

still ~localized: *In-plane*  $Q_{\parallel}$  is  $> 50,000$  for only 4 bulk periods

## Hole Slab

$$\epsilon = 11.56$$

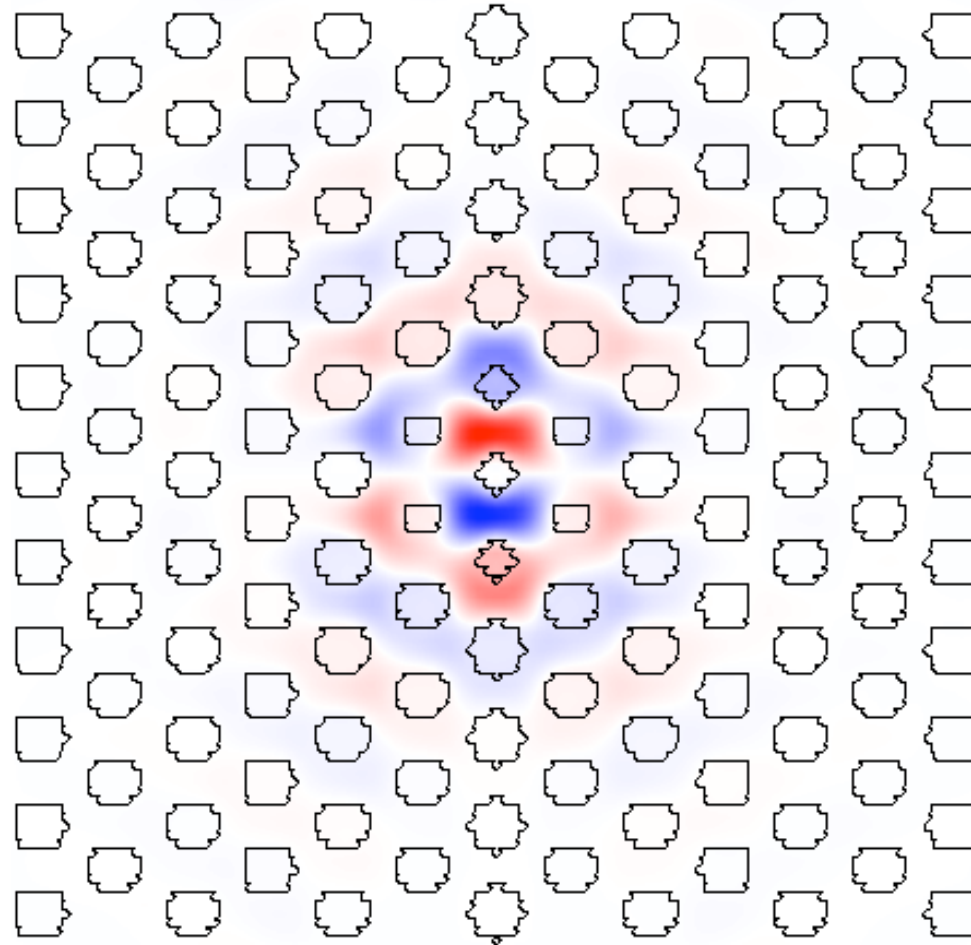

period  $a$ , radius  $0.3a$   
thickness  $0.5a$

Reduce radius of  
7 holes to  $0.2a$

$$Q = 2500$$

near mid-gap ( $\Delta\text{freq} = 0.03$ )

Very **robust** to **roughness**  
(note **pixellization**,  $a = 10$  pixels).

# How do we compute Q?

(via 3d FDTD [finite-difference time-domain] simulation)

1

excite cavity with **dipole** source

(**broad bandwidth**, e.g. Gaussian pulse)

... monitor field at some **point** ◦

...extract frequencies, decay rates via  
fancy signal processing (not just FFT/fit)

[ V. A. Mandelshtam, *J. Chem. Phys.* **107**, 6756 (1997) ]

**Pro:** no *a priori* knowledge, get all  $\omega$ 's and Q's at once

**Con:** no separate  $Q_w/Q_r$ ,  
mixed-up field pattern if multiple resonances

# How do we compute Q?

(via 3d FDTD [finite-difference time-domain] simulation)

2

excite cavity with  
**narrow-band dipole** source  
(e.g. temporally broad Gaussian pulse)  
— source is **at  $\omega_0$  resonance**,  
which **must already be known** (via **1**)

...measure outgoing power **P** and energy **U**

$$Q = \omega_0 U / P$$

**Pro:** separate  $Q_w/Q_r$ , also get field pattern when multimode

**Con:** requires separate run **1** to get  $\omega_0$ ,  
long-time source for closely-spaced resonances

Can we increase  $Q$   
**without** delocalizing?

# Semi-analytical losses

*Another* low-loss strategy:

exploit **cancellations** from sign oscillations

$$\vec{E}(\vec{x}) = \int_{\text{defect}} \vec{G}_{\omega}(\vec{x}, \vec{x}') \cdot \vec{E}(\vec{x}') \cdot \Delta \varepsilon(\vec{x}')$$

Diagram illustrating the semi-analytical loss strategy equation:

The equation is:  $\vec{E}(\vec{x}) = \int_{\text{defect}} \vec{G}_{\omega}(\vec{x}, \vec{x}') \cdot \vec{E}(\vec{x}') \cdot \Delta \varepsilon(\vec{x}')$

Labels and connections:

- $\vec{E}(\vec{x})$  is labeled "far-field (radiation)".
- $\vec{G}_{\omega}(\vec{x}, \vec{x}')$  is labeled "Green's function (defect-free system)".
- $\vec{E}(\vec{x}')$  is labeled "near-field (cavity mode)".
- $\Delta \varepsilon(\vec{x}')$  is labeled "defect".

A red bracket above the integral indicates that the strategy exploits cancellations from sign oscillations.

# Need a more compact representation

Cannot cancel **infinitely many  $\mathbf{E}(x)$**  integrals

Radiation pattern from **localized source...**

- use **multipole expansion**  
& cancel largest moment

# Multipole Expansion

[ Jackson, *Classical Electrodynamics* ]

radiated field =

Each term's strength = **single integral** over **near field**

...one term is **cancellable** by tuning one defect parameter

# Multipole Expansion

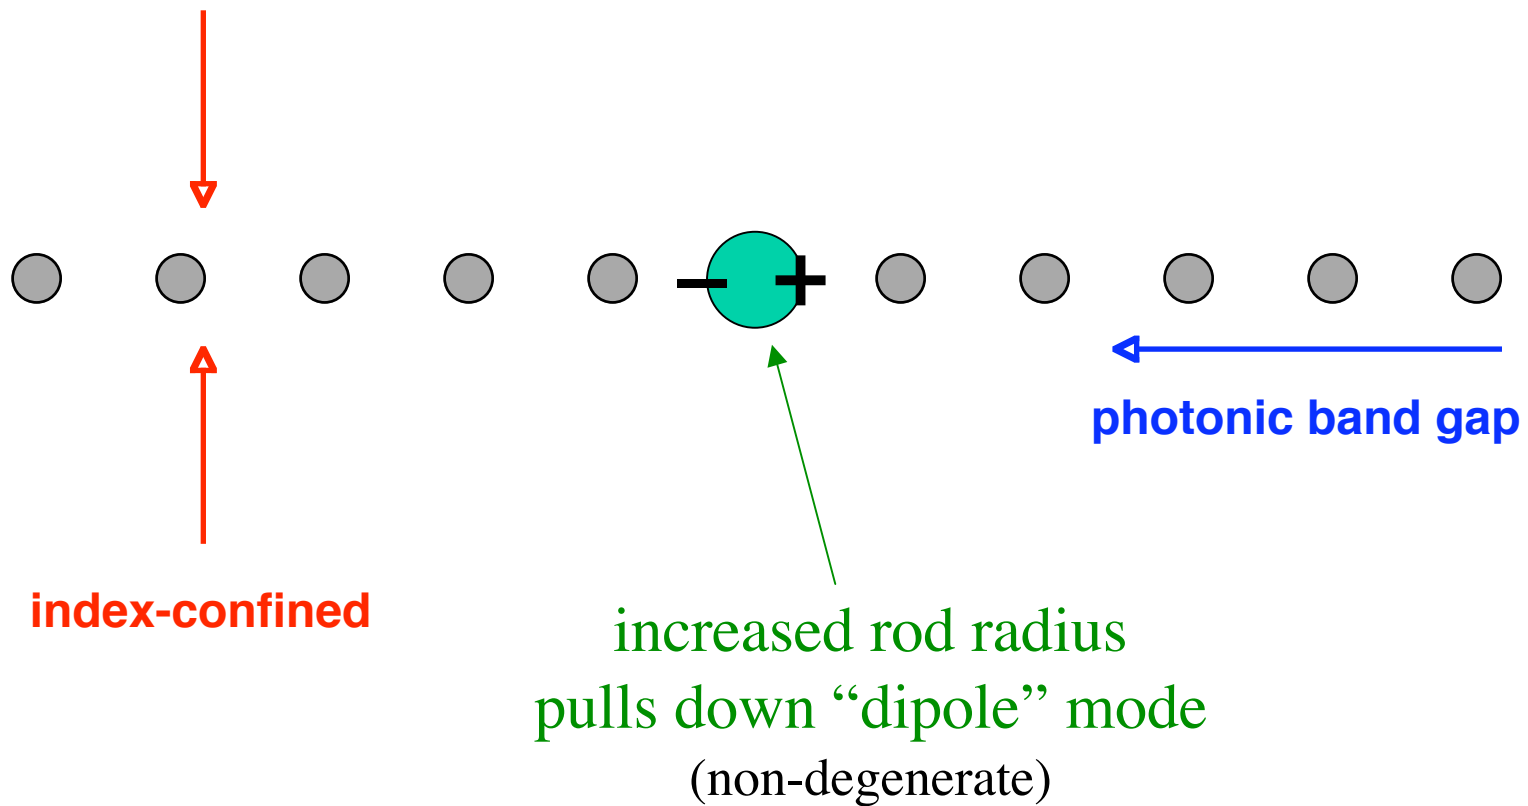

[ Jackson, *Classical Electrodynamics* ]

radiated field =

peak Q (cancellation) = transition to **higher-order radiation**

# Multipoles in a 2d example

as we change the radius,  $\omega$  sweeps across the gap

# 2d multipole cancellation

cancel a dipole by opposite dipoles...

cancellation comes from  
opposite-sign fields in adjacent rods

... changing radius changed balance of dipoles

# 3d multipole cancellation?

enlarge center & adjacent **rods**

**quadrupole mode**

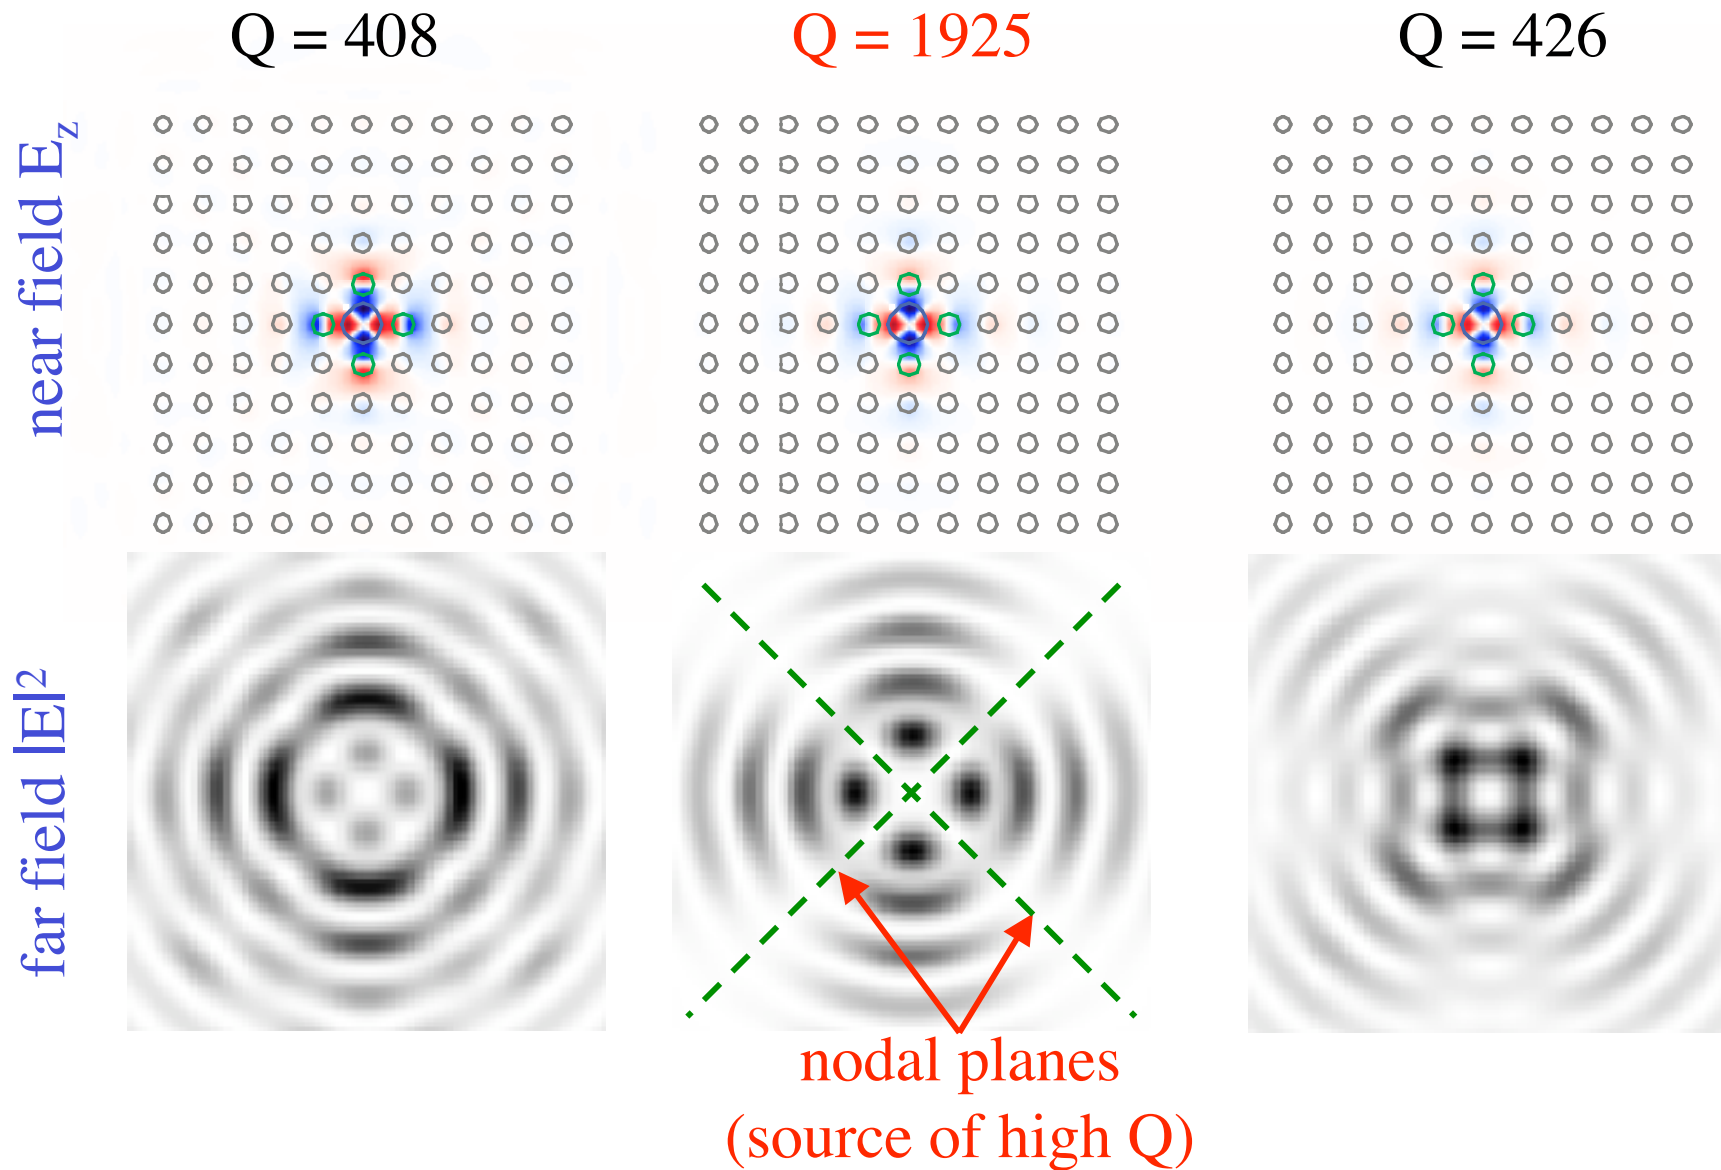

**vary side-rod  $\epsilon$  slightly**  
**for continuous tuning**

(balance central moment with opposite-sign side rods)

# 3d multipole cancellation

# An Experimental (Laser) Cavity

[ M. Loncar *et al.*, *Appl. Phys. Lett.* **81**, 2680 (2002) ]

Elongation  $p$  is a **tuning parameter** for the cavity...

...in simulations,  $Q$  peaks sharply to  $\sim 10000$  for  $p = 0.1a$

(likely to be a multipole-cancellation effect)

\* actually, there are two cavity modes;  $p$  breaks degeneracy

# An Experimental (Laser) Cavity

[ M. Loncar *et al.*, *Appl. Phys. Lett.* **81**, 2680 (2002) ]

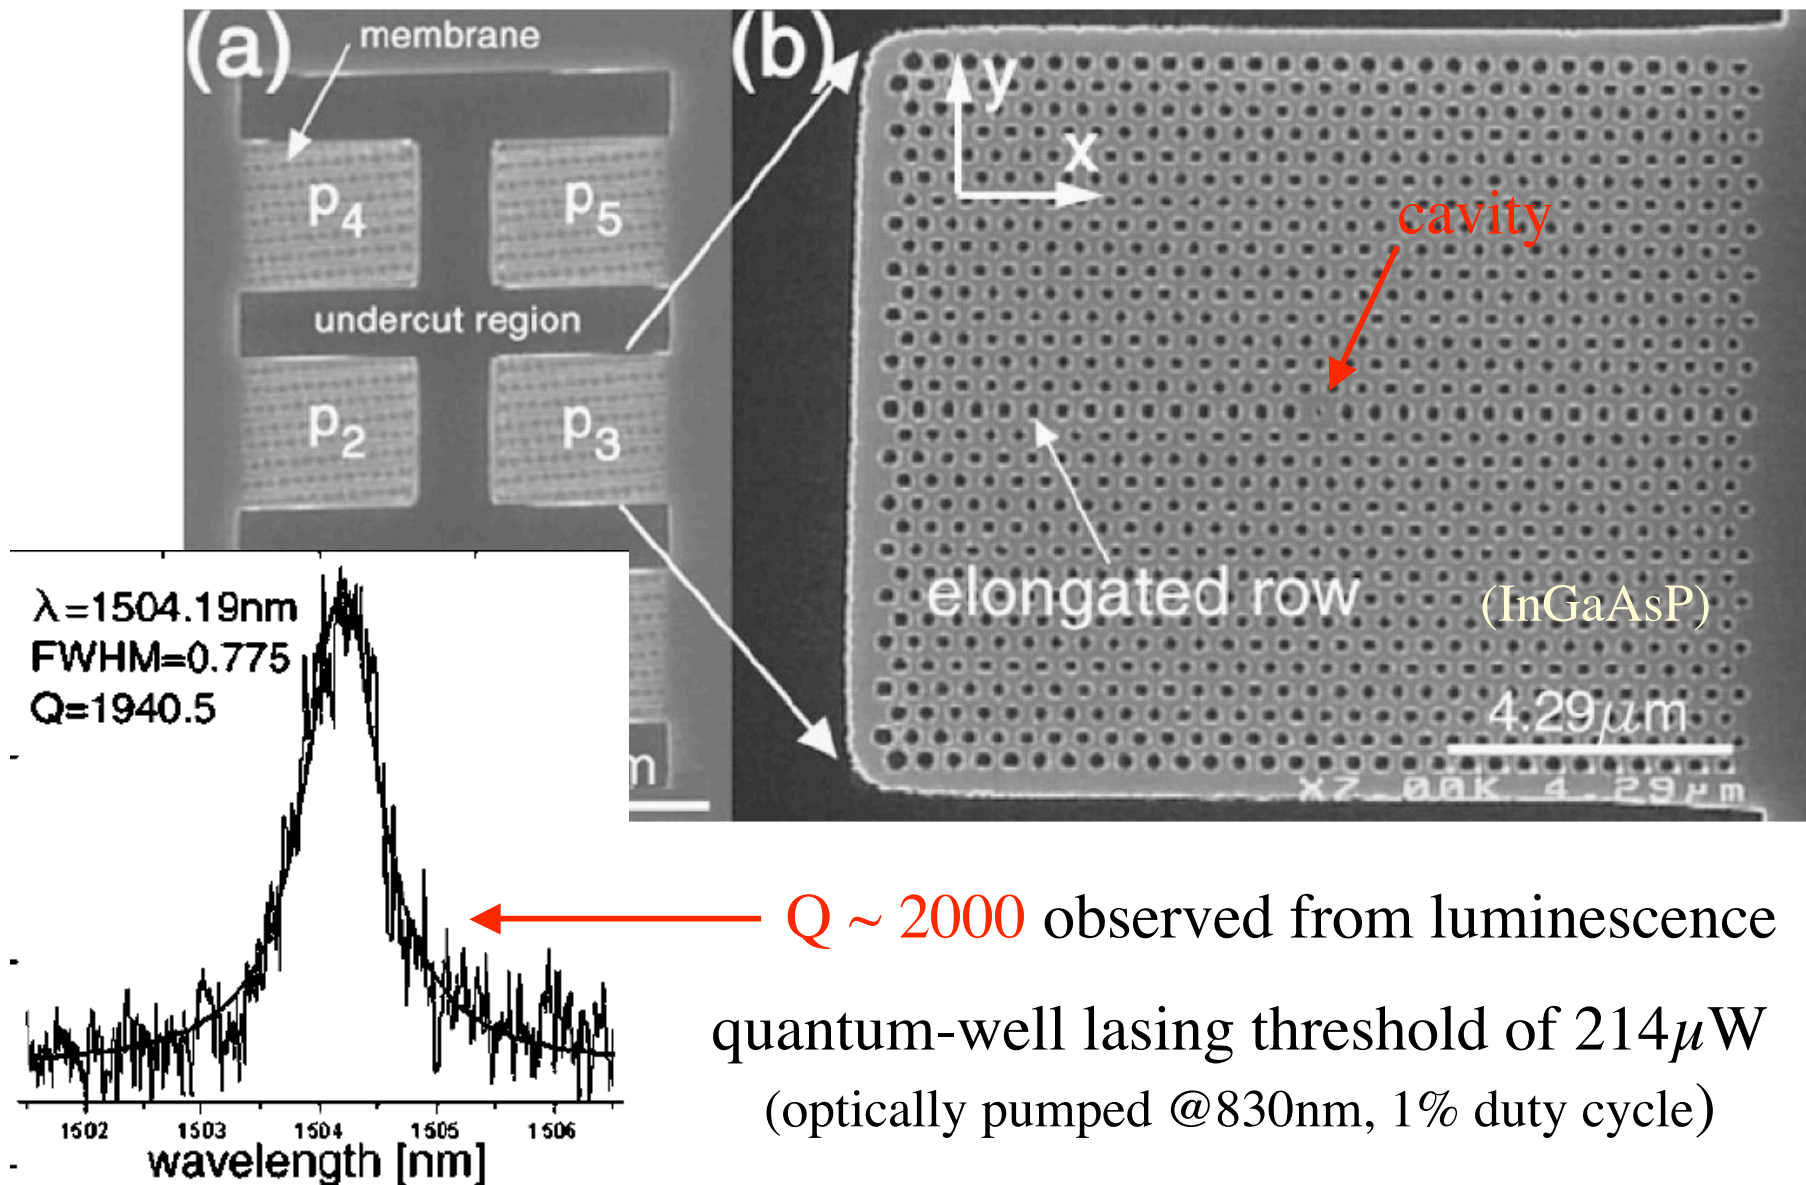

Elongation  $p$  is a **tuning parameter** for the cavity...

...in simulations,  $Q$  peaks sharply to  $\sim 10000$  for  $p = 0.1a$   
(likely to be a multipole-cancellation effect)

\* actually, there are two cavity modes;  $p$  breaks degeneracy

# An Experimental (Laser) Cavity

[ M. Loncar *et al.*, *Appl. Phys. Lett.* **81**, 2680 (2002) ]

# Slab Cavities in Practice: $Q$ vs. $V$

[ Loncar, *APL* **81**, 2680 (2002) ]

$Q \sim 10,000$  ( $V \sim 4 \times \text{optimum}$ )  
 $= (\lambda/2n)^3$

[ Akahane, *Nature* **425**, 944 (2003) ]

$Q \sim 45,000$  ( $V \sim 6 \times \text{optimum}$ )

410 nm    420 nm    410 nm

[ Song, *Nature Mat.* **4**, 207 (2005) ]

[ Ryu, *Opt. Lett.* **28**, 2390 (2003) ]

1.0 0.1 0.01 E-3 E-4

$\Gamma$  M  $K$  (theory only)

$Q \sim 10^6$  ( $V \sim 11 \times \text{optimum}$ )

$Q \sim 600,000$  ( $V \sim 10 \times \text{optimum}$ )

How can we get *arbitrary*  $Q$   
with *finite* modal volume?

~~Only one way:~~

a full 3d band gap

(or perfect metal)

There is **one other** alternative...

[ M. R. Watts *et al.*, *Opt. Lett.* **27**, 1785 (2002) ]

# The Basic Idea, in 2d

start with:  
junction of two waveguides

**No radiation** at junction  
if the modes are **perfectly matched**

# Perfect Mode Matching

requires:

same **differential equations** and **boundary conditions**

**Match differential equations...**

$$\epsilon_2 - \epsilon_1 = \epsilon_2' - \epsilon_1'$$

...closely related to **separability**  
[ S. Kawakami, *J. Lightwave Tech.* **20**, 1644 (2002) ]

# Perfect Mode Matching

requires:

same **differential equations** and **boundary conditions**

**Match boundary conditions:**

**field must be TE**  
**(*E* out of plane, in 2d)**

(note switch in TE/TM convention)

# TE modes in 3d

for

**cylindrical** waveguides,

“azimuthally polarized”

**TE<sub>0n</sub>** modes

# A Perfect Cavity in 3d

(~ VCSEL + perfect lateral confinement)

Perfect index  
confinement  
(no scattering)

+

1d band gap

=

3d confinement

# A Perfectly Confined Mode

$$\varepsilon_1, \varepsilon_2 = 9, 6$$

$$\varepsilon_1', \varepsilon_2' = 4, 1$$

$\lambda/2$  core

E energy density, vertical slice

# Q limited only by finite size

# Q-tips

Three **independent** mechanisms for high Q:

**Delocalization: trade off modal size for Q**

*$Q_r$  grows monotonically towards band edge*

**Multipole Cancellation: force higher-order far-field pattern**

*$Q_r$  peaks inside gap*

**New nodal planes** appear in far-field pattern at peak

**Mode Matching: allows arbitrary Q, finite V**

Requires special symmetry & materials

Forget these devices...

I just want a mirror.

ok

# Outline

- Preliminaries: waves in periodic media
- Photonic crystals in theory and practice
- Bulk crystal properties
- Intentional defects and devices
- Index-guiding and incomplete gaps
- **Perturbations, tuning, and disorder**

# All Imperfections are Small

(or the device wouldn't work)

- **Material absorption**: small **imaginary  $\Delta\epsilon$**
- **Nonlinearity**: small  **$\Delta\epsilon \sim |E|^2$**  (Kerr)
- **Stress (MEMS)**: small  **$\Delta\epsilon$**  or small  **$\epsilon$  boundary shift**
- **Tuning by thermal, electro-optic, etc.**: small  **$\Delta\epsilon$**
- **Roughness**: small  **$\Delta\epsilon$**  or **boundary shift**

Weak effects, long distance/time: hard to compute directly  
— use semi-analytical methods

# Semi-analytical methods for small perturbations

- Brute force methods (FDTD, *etc.*):  
expensive and give limited insight
- **Semi-analytical** methods
  - numerical solutions for perfect system  
+ analytically bootstrap to imperfections
    - ... coupling-of-modes, perturbation theory,  
Green's functions, coupled-wave theory, ...

# Perturbation Theory

for Hermitian eigenproblems

given eigenvectors/values:  $\hat{O}|u\rangle = u|u\rangle$

...find change  $\Delta u$  &  $\Delta|u\rangle$  for small  $\Delta\hat{O}$

Solution:

expand as power series in  $\Delta\hat{O}$

$$\Delta u = 0 + \Delta u^{(1)} + \Delta u^{(2)} + \dots$$

$$\& \Delta|u\rangle = 0 + \Delta|u\rangle^{(1)} + \dots$$

$$\Delta u^{(1)} = \frac{\langle u | \Delta\hat{O} | u \rangle}{\langle u | u \rangle}$$

(first order is usually enough)

# Perturbation Theory

for electromagnetism

$$\begin{aligned}\Delta\omega^{(1)} &= \frac{c^2}{2\omega} \frac{\langle \mathbf{H} | \Delta\hat{A} | \mathbf{H} \rangle}{\langle \mathbf{H} | \mathbf{H} \rangle} \\ &= -\frac{\omega}{2} \frac{\int \Delta\varepsilon |\mathbf{E}|^2}{\int \varepsilon |\mathbf{E}|^2}\end{aligned}$$

...e.g. **absorption**  
gives imaginary  $\Delta\omega$   
= decay!

or:  $\Delta k^{(1)} = \Delta\omega^{(1)} / v_g$

$$v_g = \frac{d\omega}{dk}$$

$$\Rightarrow \frac{\Delta\omega^{(1)}}{\omega} = -\frac{\Delta n}{n} \cdot (\text{fraction of } \varepsilon |\mathbf{E}|^2 \text{ in } \Delta n)$$

# A Quantitative Example

Gas can have  
low loss  
& nonlinearity

...but what about  
the cladding?

...*some* field  
penetrates!

& may need to use  
very “bad” material  
to get high index contrast

# An Old Friend: the $TE_{01}$ mode

lowest-loss mode,  
just as in metal

(near) node at interface  
= strong confinement  
= low losses

non-degenerate mode  
— cannot be split  
= no birefringence or PMD

# Suppressing Cladding Losses

Mode Losses  
÷  
Bulk Cladding Losses

Large differential loss

TE<sub>01</sub> strongly suppresses  
cladding absorption

(like ohmic loss, for metal)

# Quantifying Nonlinearity

$\Delta\beta \sim \text{power } P \sim 1 / \text{lengthscale}$  for nonlinear effects

$$\gamma = \Delta\beta / P$$

= **nonlinear-strength** parameter determining  
self-phase modulation (SPM), four-wave mixing (FWM), ...

(unlike “effective area,”  
tells *where* the field is,  
not just how big)

# Suppressing Cladding Nonlinearity

[ Johnson, *Opt. Express* 9, 748 (2001) ]

**Mode Nonlinearity\***  
÷  
**Cladding Nonlinearity**

Will be **dominated** by  
**nonlinearity of air**

**~10,000 times weaker**  
than in silica fiber  
(including factor of 10 in area)

\* “nonlinearity” =  $\Delta\beta^{(1)} / P = \gamma$

# A ~~Linear~~ *Nonlinear* “Transistor”

*Entire* nonlinear response  
from *one* linear calculation:

Lorentzian mode  $\omega$ ,  $Q$

+

Kerr  $\Delta\omega \sim |\mathbf{E}|^2$

(to first order)

**Bistable** (hysteresis) response

[ Soljacic *et al.*, *PRE Rapid. Comm.* **66**, 055601 (2002). ]

# Tuning Microcavities

Fabrication accurate to  $10^{-3}$  or  $10^{-6}$  (bandwidth) is challenging

...need post-fabrication tuning

Tuning mechanisms: electro-optic, thermal, conductivity, liquid crystal...

alter cavity index *or shape*

[ C.-W. Wong, *Appl. Phys. Lett.* **84**, 1242 (2004). ]

stretch piezo-electrically  
(MEMS)

# Boundary-perturbation theory

$$\Delta\epsilon = \epsilon_1 - \epsilon_2$$

$$\Delta\epsilon = \epsilon_2 - \epsilon_1$$

... just plug  $\Delta\epsilon$ 's into  
perturbation formulas?

**FAILS** for high index contrast!

beware field discontinuity...

fortunately, a simple correction exists

[ S. G. Johnson *et al.*,  
*PRE* **65**, 066611 (2002) ]

# Boundary-perturbation theory

$\Delta\epsilon = \epsilon_1 - \epsilon_2$   
 $\Delta\epsilon = \epsilon_2 - \epsilon_1$   
 (continuous field components)

$$\Delta\omega^{(1)} = -\frac{\omega}{2} \frac{\int_{\text{surf.}} \Delta h \left[ \Delta\epsilon |\mathbf{E}_{\parallel}|^2 - \Delta \frac{1}{\epsilon} |D_{\perp}|^2 \right]}{\int \epsilon |\mathbf{E}|^2}$$

[ S. G. Johnson *et al.*,  
*PRE* **65**, 066611 (2002) ]

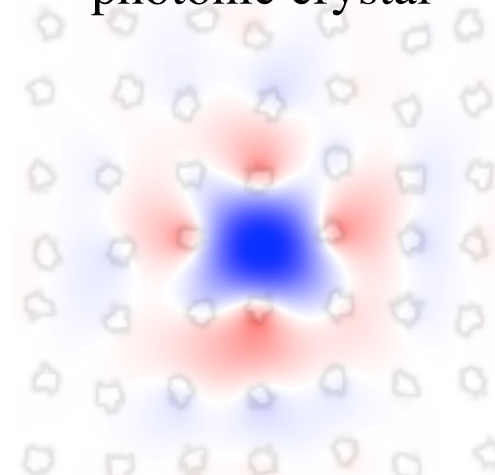

# Surface roughness disorder?

[ <http://www.physik.uni-wuerzburg.de/TEP/Website/groups/opto/etching.htm> ]

loss limited by disorder

disordered  
photonic crystal

[ A. Rodriguez, MIT ]

**theorem:** [ S. Fan *et. al.*, *J. Appl. Phys.* **78**, 1415 (1995). ]

small (bounded) disorder does not destroy the bandgap

*Q* limited only by crystal size (for a 3d complete gap) ...

... but waveguides have more trouble ...

# Effect of Gap on Disorder (e.g. Roughness) Loss?

[ with M. Povinelli ]

index-guided waveguide

photonic-crystal waveguide: which picture is correct?

radiation blocked  
increased reflection

OR

radiation blocked  
no increase in reflection

# Coupled-mode theory

$$|\psi\rangle = \sum_n c_n(z) |n\rangle e^{i\beta_n z}$$

wavenumber

state (field)  
of disordered  
waveguide

expansion  
coefficient

eigenstate of perfect waveguide

→  $z$

# What's New in Coupled-Mode Theory?

- Traditional methods (Marcuse, 1970): **weak periodicity** only
- **Strong periodicity** (**Bloch modes** expansion):
  - de Sterke *et al.* (1996): coupling in *time* (nonlinearities)
  - Russell (1986): **weak** perturbations, **slowly varying** only

**NEW: exact extension**, for  $z$ -dependent (constant  $\omega$ ), and:  
arbitrary periodicity,  
arbitrary index contrast (full vector),  
arbitrary disorder [ and/or tapers ]

[ S. G. Johnson *et al.*, *PRE* **66**, 066608 (2002). ]

[ M. L. Povinelli *et al.*, *APL* **84**, 3639 (2004). ]

[ M. Skorobogatiy *et al.*,

*Opt. Express* **10**, 1227 (2002). ]

scalar

full-vector

# Coupled-wave Theory

(skipping all the math...)

$$\frac{dc_n}{dz} = \sum_{m \neq n} [\text{coupling}]_{m,n} e^{i\Delta\beta z} c_m$$

mode expansion coefficients

Depends only on: [ M. L. Povinelli *et al.*, *APL* **84**, 3639 (2004). ]

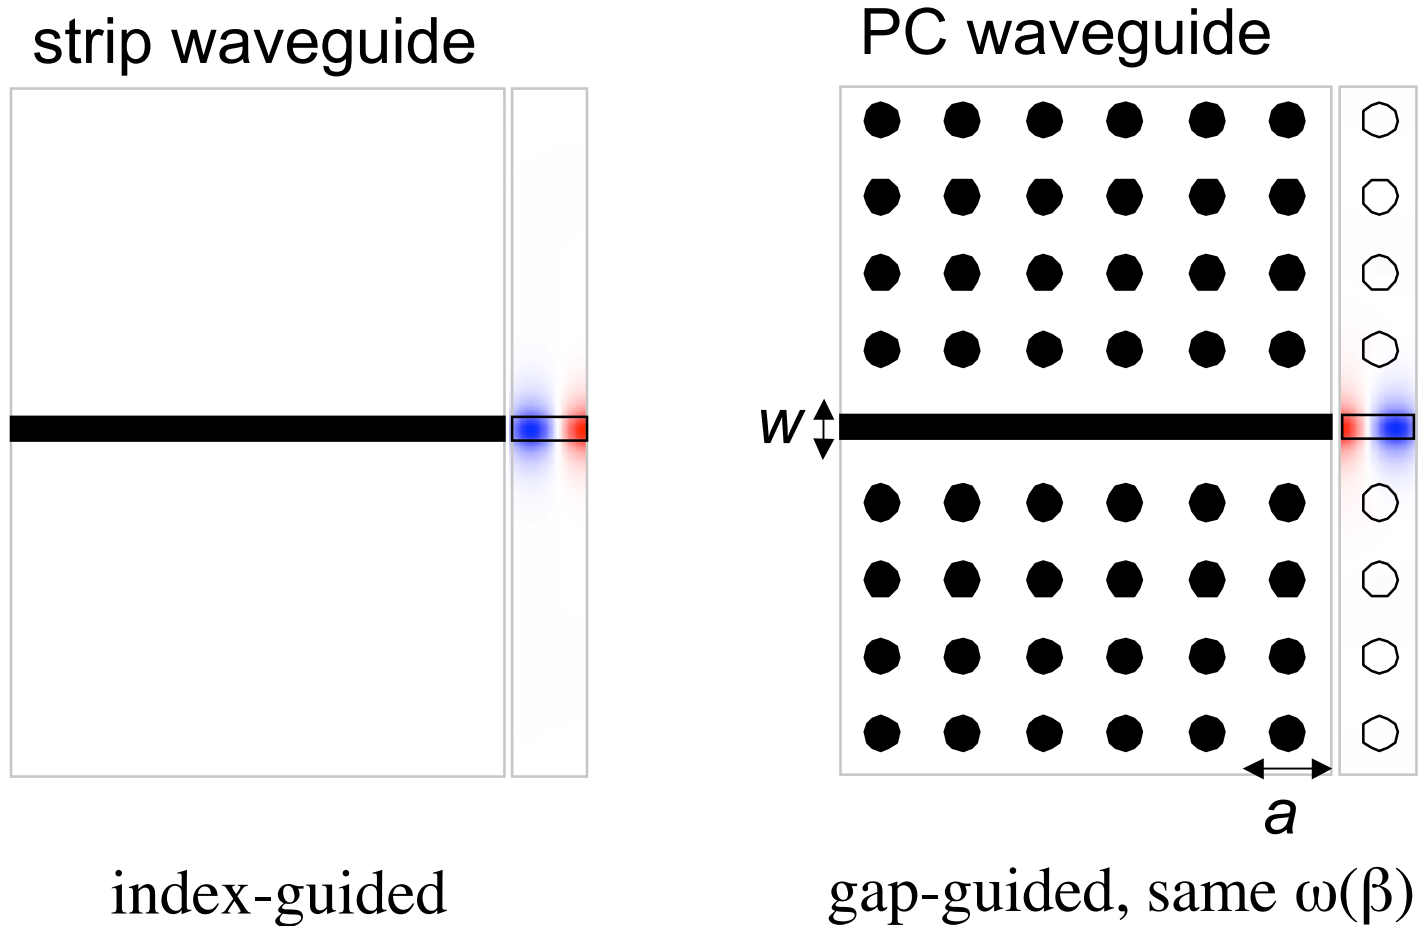

- strength of disorder
- mode field at disorder
- group velocities

→ Weak disorder, short correlations: refl.  $\sim |\text{coupling}|^2$   
if disorder and modes are “same,”  
then reflection is the same

# A Test Case

[ M. L. Povinelli *et al.*, *APL* **84**, 3639 (2004). ]

Apples to Apples

# A Test Case

pixels added/removed with probability  $p$

*same* disorder in both cases, averaged over many FDTD runs

# Test Case Results: Reflection

# Test Case Results: Total Loss

photonic bandgap  
(all other things equal)  
= unambiguous improvement

But, the news isn't all good...

# Group-velocity ( $v$ ) dependence other things being equal

[ S. G. Johnson *et al.*, *Proc. 2003 Europ. Symp. Phot. Cryst.* **1**, 103. ]

[ S. Hughes *et al.*, *Phys. Rev. Lett.* **94**, 033903 (2005). ]

absorption/radiation-scattering loss  
(per distance)  $\sim 1/v$

reflection loss  
(per distance)  $\sim 1/v^2$   
(per time)  $\sim 1/v$

Losses a challenge for slow light...

# An Easier Way to Compute Loss

imperfection acts like a volume current

$$\vec{J} \sim \Delta\varepsilon \vec{E}_0$$

volume-current method

(i.e., first Born approx. to Green's function)

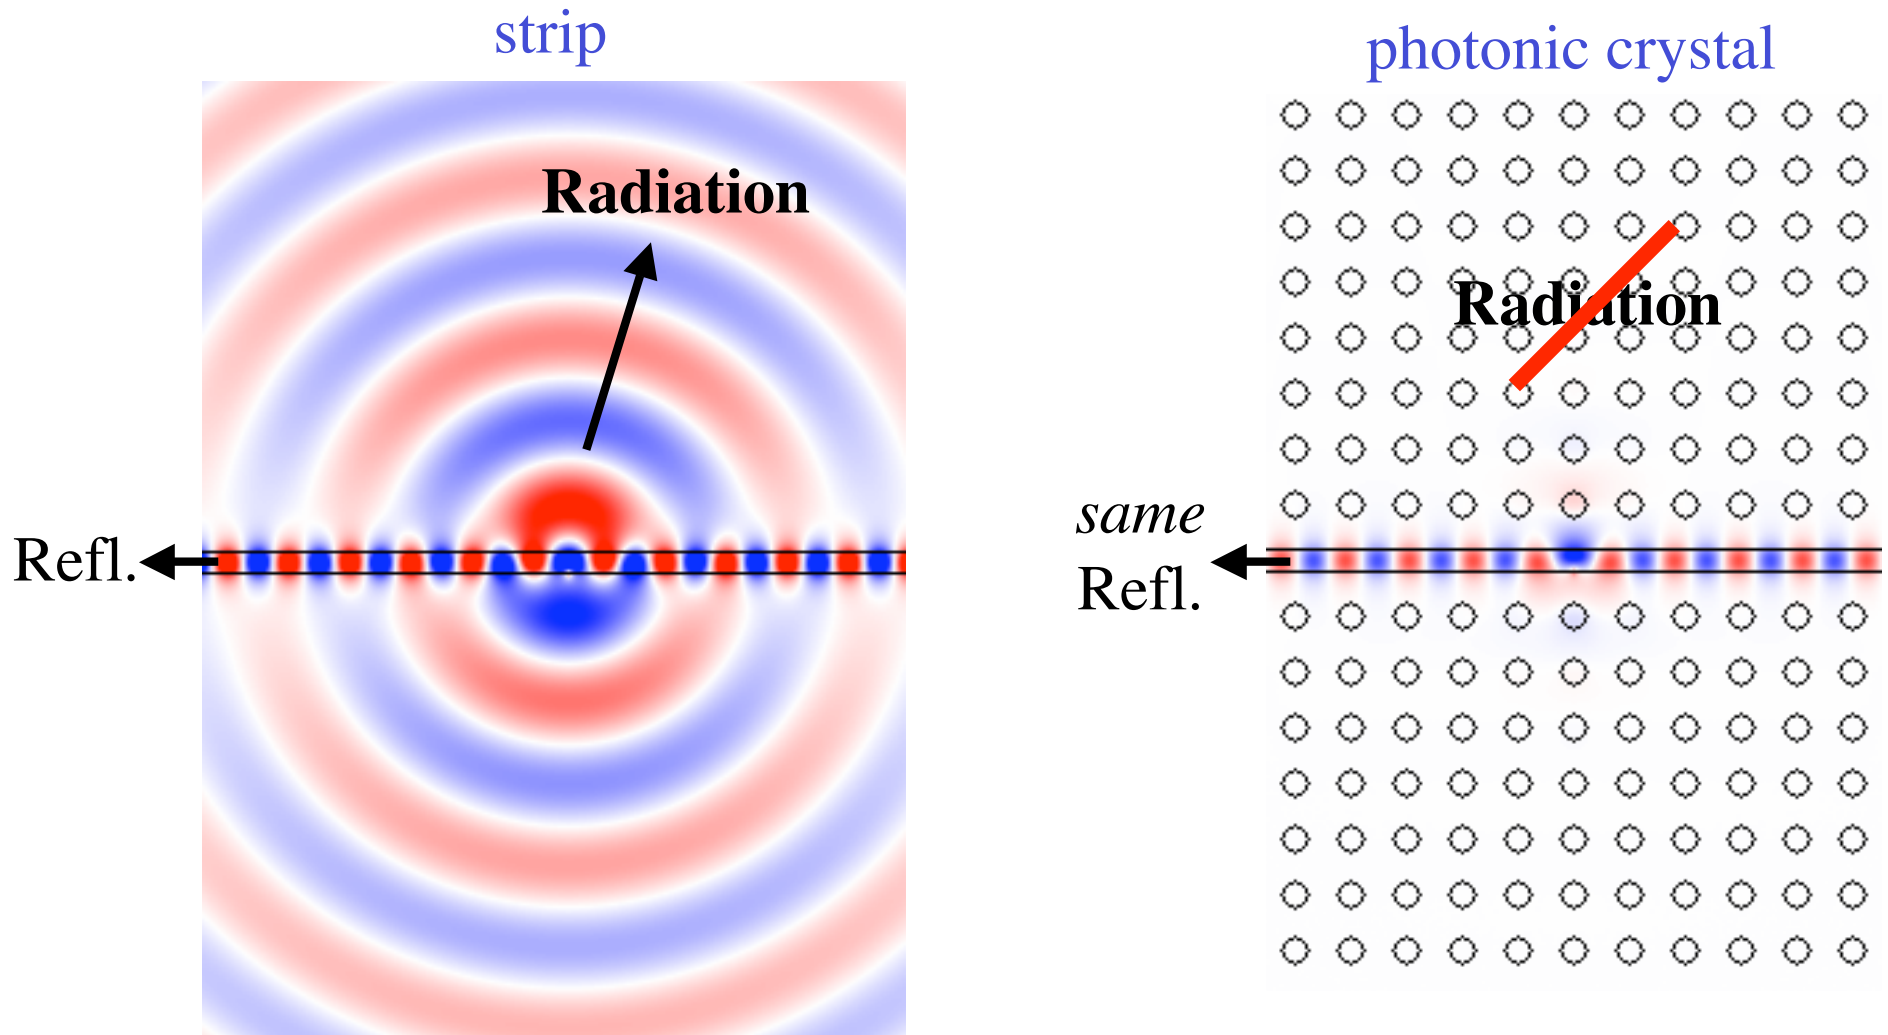

# An Easier Way to Compute Loss

So, compute power  $P$  radiated by *one* localized source  $J$ ,  
and **loss rate**  $\sim P^*$  (mean disorder strength)

# Losses from Point Scatterers

Loss rate ratio = (Refl. only) / (Refl. + Radiation) = 60% ✓

# Effect of an *Incomplete* Gap

on uncorrelated surface roughness

Conventional waveguide  
(matching modal area)

...with Si/SiO<sub>2</sub> Bragg mirrors (1D gap)

**50% lower losses (in dB)**

**same reflection**

# Failure of the Volume-current Method

imperfection acts like a volume current

$$\vec{J} \sim \cancel{\Delta\epsilon} \vec{E}_0$$

*Incorrect* for large  $\Delta\epsilon$  (except in 2d TM polarization)

$\Delta\epsilon$  “bump” *changes E*  
( $E_{\perp}$  is *discontinuous*)

# Scattering Theory (for small scatterers)

[ e.g. Jackson, *Classical Electrodynamics* ]

**sphere:** *effective* point current  $\mathbf{J} \sim \mathbf{p} / \Delta V$   
 $= 3 \Delta\epsilon \mathbf{E}_0 / (\Delta\epsilon + 3)$

$= \Delta\epsilon \mathbf{E}_0$  for small  $\Delta\epsilon$ , but **very different for large  $\Delta\epsilon$**

# Corrected Volume Current for Large $\Delta\epsilon$

$$\text{effective point current } \mathbf{J} \sim \left( \frac{\epsilon_1 + \epsilon_2}{2} \mathbf{p}_{\parallel} + \epsilon \mathbf{p}_{\perp} \right) / \Delta V$$

[ S. G. Johnson *et al.*, *Applied Phys. B*, in press (2005). ]

# Strip Waveguides in Photonic-Crystal Slabs (3d)

How does *incomplete 3d gap* affect roughness loss?

# Rods: Surface-corrugation

vertical "ridge"  
= line source

Loss With Crystal / Without Crystal

# Holes: Surface-corrugation

# Rods vs. Holes? *Answer is in 2d.*

The **hole waveguide** is not single mode  
— crystal introduces new modes (in 2d)  
and **new leaky modes** (in 3d)

*The story of photonic crystals:*

**Finding New Materials / Processes**  
**⇒ Designing New Structures**
